File: USPT

Oct 20, 1998

DOCUMENT-IDENTIFIER: US 5824544 A

TITLE: Adenovirus vectors for gene therapy

## CLAIMS:

1. A replication-defective adenovirus vector having a deleted E1 region of the adenovirus genome, and in which the protein IX gene has been relocated in the adenovirus genome to a location thereof other than the location in which said protein IX gene normally resides, such that generation of replication-competent adenoviruses is minimized or eliminated.

\*\* See image for Certificate of Correction \*\*

TITLE: Packaging systems for human recombinant adenovirus to be used in gene therapy

## CLAIMS:

1. A method of making replication-defective adenovirus lacking functional adenoviral E1A and E1B proteins comprising a) providing a primary cell comprising a first nucleic acid sequence encoding functional E1A protein and E1B protein but not pIX protein; b) transfecting said cell with a second nucleic acid sequence comprising at least one functional adenoviral encapsidating signal and at least one functional adenoviral inverted terminal repeat, wherein said second nucleic acid sequence does not encode functional adenoviral E1A or E1B; and further wherein said first and second nucleic acids sequences lack overlapping sequences, the overlapping sequences otherwise enabling homologous recombination leading to replication competent adenovirus in said cell; c) culturing the transfected cell; and d) harvesting replication-defective adenovirus lacking functional adenoviral E1A and E1B from the cultured cell.
